# Lithography

**lecture 16 - litho introduction** - the fundamental limit of optical lithography is not determined by the optical system alone but rather is an overall contributions from the optics, resist, develop and etching processes. process window: capability of printing small features does not always guarantee a good quality and a repeatable and controllable patterning. alignment: **history of litho - sites** - a half, lithography was a very small segment of the printing industry, used mainly by artists to produce prints. however, during the late 1800's and throughout the twentieth century, great advancements in technology made lithography into the most popular form of printing in the united states. the history of lithography occurred in four **lecture 25: lithography - nptel** - before the lithography step, the wafer surface should be clean and defect free. presence of defects, before and after lithography, can affect the pattern transfer process and produce a non-working device. the various ways in which dust particles can interfere with the lithographic mask are shown in figure 8. **lecture 7 lithography and pattern transfer reading: chapter 7** - focus. thus, for high resolution lithography the surface must be planar (flat). wafer metal oxide line high resolution (small depth of field) lithography can focus on point a or b but not a and b simultaneously a b **lithography - university of colorado boulder** - • lithography qualification - resolution patterns - vernier • automatic alignment - moire pattern alignment marks features on wafer features on mask mask over wafer aligned. 18 • photoresist is sculpted by a spatially variable exposure. **euv lithography: present and future** - evl lithography workshop 2016 39 summary • evl lithography is heading for high volume manufacturing! • engineers still have work to do, but one can see the light at the end of the tunnel. • yield. • process control. • opc. • mask defectivity could limit applicability of evl lithography. **ee143 f2010 lecture 4 photolithography** - ee143 f2010 lecture 4 1 photolithography "minimum feature resolution "depth of focus "overlay errors "photoresist response "e-beam and evl lithography key topics: photo = s= (through) light litho = s= stone graphy = = writing **photolithography theory - university of florida** - 1 photolithography theory 1. introduction optical lithography is the process of creating specific patterns on semiconductor wafers using a photosensitive material (known as photoresist, pr) and an ultraviolet light exposure system to **lecture 17 -- holographic lithography** - lattices formed by holographic lithography are inherently chirped. this is due to absorption of the photoresist. low absorption and high contrast resists help reduce chirp, but it is always present. raymond c. rumpf and eric g. johnson," fully three-dimensional modeling of the fabrication and optical
